The goal of the theme eHealth (eHälsa) is to establish a holistic view of eHealth by combining different perspectives and areas of expertise and to promote a constructive and critical discussion on eHealth and its complexity and to review both existing and future possibilities and challenges. eHealth is probably the largest wave of change in healthcare since the New Public Management wave between 1980 and 2000. Deployment of eHealth can be seen as a paradigm shift with the aim to enable patients increased access and influence over their health situation by emphasizing “patient authorization”, “patient transparency” and “patient empowerment”. Many key actors even see eHealth as a panacea for the impending shortage of healthcare resources. Our overall aim is to contribute to the understanding of how eHealth services and systems can be developed, introduced, used and made comprehensible as sustainable solutions that develop medical services for citizens (patients, customers) and healthcare personnel. We also want to contribute to a multidisciplinary theoretical and empirical understanding of this expansive information environment for healthcare and society as a whole.
