The group aims to develop a critical method for analysing climate visions and climate scenarios. An analysis of visions and scenarios on climate and climate policies is based on a number of questions, which are developed in group discussions with the help of invited researchers.

The first task is to analyse scenarios, primarily those presented by national public authorities. We have chosen to use *Sweden 2025* from the National Board of Housing, Building and Planning. This plan contains a large number of aspects that are suitable for analysis, and is very visionary in its design. (See [http://sverige2025.boverket.se](http://sverige2025.boverket.se)).

*Sweden 2025* is to be analysed from an intersectional perspective. The method is based on posing fundamental questions about the formulation and expression of policy: “What is construed as the problem?” Carol Bacci (2009) recommends six question that focus on power and problem formulation. In brief: the problem as it appears in specific sub policies, the basic assumptions underpinning a way to present a problem, which aspects will be made “non-problematic” i.e. what is not being mentioned? How has the interpretation come about, how is it defended, and how can it be questioned?

This is a way of reviewing visions and policies on a quite general level. However, it is possible to go further and analyse climate issues specifically from an intersectional perspective. Kaijser and Kronsell (2014) propose a number of questions that review how *social categories*, *concepts for nature and the environment* and *normative structures* are expressed in documents. These discussion frameworks will be developed during the year in order to arrive at a developed method for the analysis of scenarios and political visions in the environmental and climate area, including contributions from invited guests.
